

BURGER KING

Sales & Profitability Dashboard

Power BI Project Documentation

Project Type	Portfolio / Learning Project
Tool	Microsoft Power BI
Data	Synthetic Burger King-style restaurant dataset
Analysis Period	01 Jan 2025 – 30 Jun 2026
Primary Goal	Turn sales data into actionable business insights

Disclaimer: This is a portfolio/learning project using synthetic Burger King-style data. It is not official Burger King data and is not affiliated with Burger King or Restaurant Brands Asia.

1. Project Overview

The dashboard analyzes restaurant sales and profitability from multiple business perspectives. The analysis follows a clear business-question flow: **What is happening?** → **Where is the problem?** → **What could be causing it?** → **What decision can be taken?**

Business Objectives

Objective	Business Question
Sales performance	How are revenue and orders changing over time?
Product performance	Which products and categories are driving sales?
Store performance	Which stores generate strong revenue and profitability?
Profitability	Where are margins relatively weak?
Peak hours	When is demand highest for staffing and inventory planning?
Root cause analysis	Which categories, products or channels may explain weaker profitability?

Dataset Structure

Orders is the main fact table. Customers, Products, Stores and Calendar act as dimensions. The workbook contains 5,000 Orders records, 1,200 Customers, 25 Products, 15 Stores and 546 Calendar dates, covering 01 Jan 2025 to 30 Jun 2026.

2. Data Model & Relationships

A star-schema approach was used so transactional order data can be analyzed consistently across product, store, customer and time dimensions.

Table	Role	Relationship
Orders	Fact table	Central transaction table
Products	Dimension	Products[Product_ID] → Orders[Product_ID]
Stores	Dimension	Stores[Store_ID] → Orders[Store_ID]
Customers	Dimension	Customers[Customer_ID] → Orders[Customer_ID]
Calendar	Date dimension	Calendar[Date] → Orders[Order_Date]

Calendar was marked as the date table, and Month was sorted by Month_Number for chronological reporting.

3. Key DAX Measures

Measure	Purpose
Total Revenue	Sum of Net_Revenue
Total Orders	Distinct count of Order_ID
Total Customers	Distinct count of Customer_ID
Total Items Sold	Sum of Quantity
Total Profit	Sum of Profit
Average Order Value	Total Revenue ÷ Total Orders
Profit Margin %	Total Profit ÷ Total Revenue

The measures were organized in a dedicated **BK Measures** table to keep calculations separate from the transaction columns.

4. Dashboard Page 1 — Sales Performance

The first page is the executive overview, combining KPI cards with time, product, store, hourly and geographic views.

Element	Purpose
5 KPI cards	Revenue, Orders, Customers, Items Sold and Profit Margin.
Monthly Revenue Trend	Shows revenue movement over time.
Revenue by Product Category	Compares category contribution.
Store Performance: Revenue vs Profit	Highlights differences between store revenue and profit.
Peak Hour Analysis	Compares orders and revenue by hour.
Geographic Revenue Performance	Shows location-level revenue patterns.
Top 5 Products Sold	Highlights the highest-volume products.
Slicers	Store, Category, Region, Order Channel and Date.

5. Dashboard Page 2 — Problem Analysis

The second page focuses on identifying where performance issues may exist and prioritizing stores for deeper investigation.

Analysis	Business Use
Store Revenue vs Profit Margin	Find stores with high revenue but comparatively weak margins.
Discount vs Profitability	Explore whether discount levels are associated with weaker profitability.
Bottom 5 Stores by Profit Margin	Prioritize stores requiring deeper investigation.

6. Dashboard Page 3 — Root Cause Analysis

The third page investigates potential drivers behind low profitability. The intended flow is: **select a problematic store** → **examine category margin** → **identify weak products** → **compare order-channel profitability**.

Visual	Purpose
Profit Margin % by Product Category	Identify categories with relatively weak margins.
Product Profitability by Store	Drill into product-level profit for the selected store.
Profit by Order Channel	Compare profitability across channels.

7. Key Business Insights & Possible Actions

Finding / Question	Potential Business Action
Peak ordering hours	Increase staffing and ensure inventory availability during high-demand periods.
High-volume products	Maintain availability and evaluate their role in bundles and promotions.
High-revenue but lower-margin stores	Review product mix, discounting, channel mix and operating factors.
Low-margin categories/products	Investigate pricing, cost structure, discounts and product mix.
Channel profitability differences	Prioritize profitable channels and review economics of weaker channels.
Geographic differences	Compare local demand and store performance before allocating promotions or resources.

8. Interactivity & User Experience

Slicers for **Store_ID**, **Category**, **Region**, **Order_Channel** and **Date** allow users to change the analytical context without creating separate reports. This supports drill-down from the overall business view to a specific store, category, region, channel or date range.

9. Data Quality Checks

The source workbook was validated before dashboard development: zero missing cells, zero broken Product_ID, Store_ID and Customer_ID references, and no duplicate Order_ID values were found.

10. Tools & Skills Demonstrated

Tools: Microsoft Power BI, DAX and Excel source data.

Skills: Data modeling, KPI design, data visualization, interactive reporting, profitability analysis, root cause analysis and business storytelling.

11. Conclusion

The dashboard moves beyond descriptive reporting. It starts with overall sales performance, moves into problem identification, and then investigates possible root causes. The overall approach is: **Data** → **Analysis** → **Insight** → **Business Decision** → **Action**.

Portfolio note: The dataset is synthetic and intended for learning and portfolio demonstration. It should not be presented as official Burger King corporate sales data.
